THIRSTY'S CODEX

STANDARDS EDITION

VOLUME XVII / 17 OF 20

TRAINING VIEWS AND INDEXES

Continuous-pretraining, evaluation, retrieval, and training views with canonical indexes

NO PROOF, NO CLAIM

CONTINUOUS MASTER FOLIO / SOURCE-PRESERVING EDITION

Edition Statement

THIRSTY'S CODEX / STANDARDS EDITION / SOURCE-PRESERVING SET

This volume is one part of a continuous 20-volume edition. Canonical lifecycle section numbers remain stable across the set; no volume restarts or renumbers them.

The visual treatment has been rebuilt as a unified standards library: coordinated covers, volume architecture, source dividers, running headers, continuous master folios, local page numbers, and source-identity marks.

The source corpus remains authoritative over the presentation layer. Status terms are preserved exactly. CONTENT-COMPLETE does not silently become source-reconciled, hostile-reviewed, owner-accepted, ratified, or published.

Every registered source witness is identified by path, byte count, and SHA-256 digest. The complete source archive is preserved as an embedded attachment in Volume XX, while the two supplied foundational PDFs are preserved as attachments in Volume I.

CONTINUITY RULE

Read the master folio and canonical section sequence as one uninterrupted work. Each succeeding volume begins where the preceding volume ends.

Standards Edition Set Map

VOLUME I
Foundations and Governance
Doctrine, prompts, front matter, shared governance, roles, and output contracts

VOLUME II
Research, Strategy, and Risk
Lifecycle Sections 001-018

VOLUME III
Requirements through Hardware Architecture
Lifecycle Sections 019-060

VOLUME IV
Electrical Engineering through User Validation
Lifecycle Sections 061-106

VOLUME V
Software Systems through Smart Contracts
Lifecycle Sections 107-150

VOLUME VI
Data, Intelligence, and Human Oversight
Lifecycle Sections 151-188

VOLUME VII
Cybersecurity through Privacy Engineering
Lifecycle Sections 189-218

VOLUME VIII
Law, Assurance, and Validation
Lifecycle Sections 219-257

VOLUME IX
Configuration through Delivery Infrastructure
Lifecycle Sections 258-300

VOLUME X
Production Operations and Command
Lifecycle Sections 301-332

VOLUME XI
Support, Enterprise, and Roadmaps
Lifecycle Sections 333-373

VOLUME XII
Maintenance, Decommissioning, and Retirement
Lifecycle Sections 374-406

VOLUME XIII
Reference Registers and Working Documentation
Indexes, cross-references, source registers, checkpoints, and operational guides

VOLUME XIV
Standards Source Library
Preserved standards, command editions, blueprints, and source artifacts

VOLUME XV
Canonical Authority and Assurance
Authority, constitutions, policies, schemas, provenance, evaluation, and verifica...

VOLUME XVI
Applied Corpus and V3Q
Agent-output corpus, V3Q implementation, fixtures, tests, and governed examples

VOLUME XVII
Training Views and Indexes
Continuous-pretraining, evaluation, retrieval, and training views with canonical ...

VOLUME XVIII
Agents and Owner Command Standards
Agents 101 and Owner's Cockpit source-standard facsimiles

VOLUME XIX
Static Analysis and Tooling Evidence
Codacy configuration, rulesets, analysis logs, and repository tooling

Volume Contents

st derived from the V4 draft; execution not performed.\n\n## Article A13 - Resolution integrity
and owner-operable authority\n\n1. `MISSING`, `INVALID`, `UNRESOLVED`, and resolved Boolean `FAL
SE` are constitutionally distinct states.\n2. Only a genuinely resolved false value may behave a
s false. An unresolved operand may not enter comparison, negation, membership, function evaluati
on, schema satisfaction, proof formation, or authorization.\n3. At an authority boundary, unreso
lved evaluation fails closed with an explicit reason. At an evidence boundary, it becomes `BLOCK
ED` or `INDETERMINATE`, never success, failure, zero, or permission by coercion.\n4. A system ma
y not manufacture authority from its inability to understand the context presented to it.\n5. Ow
ner operability is a system capability. A governed system must expose a complete owner control l
oop: observe, understand, decide, authorize, act, verify, recover, learn, preserve, and re-enter
.\n6. Decision support must not seize the owner's legitimate decision. Recommendation, authoriza
tion, execution, and verification remain separate events.\n7. Cognitive load is a governed resou
rce. Deep evidence remains reachable, but the first decision layer must surface consequential st
ate, uncertainty, and the next safe action without requiring the owner to reverse-engineer the s
ystem.\n8. Implementation, publication, CI success, or artifact verification may satisfy technic
al obligations; none may self-issue independent constitutional acceptance."}], "authority": {"so

What must Gate 12 - TRUSTED TRANSITION establish before downstream work can rely on it?"}, {"role": "assistant", "content": "STATUS: Created | Gate interpretation from the proposed V4 architecture; no live gate was evaluated.\n\n### Gate 12 - TRUSTED TRANSITION\n\nQuestion: Is the system constitutionally entitled to change trusted state?\n\nOutput: promote, quarantine, reject, hold, revoke, or request-owner-decision record with rollback and continuity.\n\n## 4. Adaptive depth and compute stewardship\n\nV4 separates `reasoning_mode` from `action_class`. A read-only task may still need constitutional reasoning; an irreversible action may be simple but require explicit authority and recovery proof.\n\nThe compiler estimates the proof burden using:\n\n- action rank;\n- irreversibility;\n- external consequence;\n- security and authority sensitivity;\n- uncertainty;\n- novelty;\n- source conflict;\n- number of dependent claims;\n- evaluator maturity;\n- cost of false positive and false negative.\n\nIt then chooses the lowest mode that can satisfy the burden. Escalation requires a reason code. High-cost work records expected information gain and cheaper probes rejected.\n\n## 5. State namespaces\n\nV4 forbids status collision. Each record uses separate namespaces:\n\n- `operational_status`: Created, Modified, Tested, Verified, etc.\n- `control_result`: pass, fail, blocked, not_applicable, waived.\n- `epistemic_state`: verified, strongly_supported, probable, plausible, conflicting_evidence, unresolved, unverified, unknowable_with_current_access.\n- `competence_state`: not_evaluated, blocked, indeterminate, demonstrated, not_demonstrated, regressed.\n- `transition_state`: proposed, held, quarantined, rejected, authorized, executed, revoked, superseded.\n\nNo serializer may map one namespace into another without an explicit, tested conversion rule.\n\n## 6. Chamber protocol\n\nThe four chambers do not vote by popularity.\n\n- DEFINE establishes the problem model and obligation lattice.\n- EXECUTE produces the candidate artifact within approved bounds.\n- CHALLENGE attempts falsification and distinguishes failure causes.\n- GOVERN evaluates authority, evidence, continuity, human impact, and decision admissibility.\n\nMaterial disagreements are returned to the obligation graph. The Decision Arbiter Advisory may recommend; it does not become Project-AI's canonical Arbiter and cannot create binding authority.\n\n## 7. Human comprehension architecture\n\nDeep work must be navigable. Every substantial output uses a cognitive gradient:\n\n1. direct determination;\n2. what changed or was discovered;\n3. architecture and dependency map;\n4. evidence and uncertainty;\n5. implementation or decision path;\n6. raw machine-readable record.\n\nComplexity may be deep. It may not be needlessly opaque.\n\n## 8. Policy-engine boundary\n\nV4 defines a policy adapter interface rather than hard-coding one language. An adapter must declare:\n\n- exact engine and version;\n- context representation;\n- schema and canonicalization;\n- positive and negative fixtures;\n- unknown and malformed behavior;\n- trace format;\n- independent conformance result;\n- bypass analysis;\n- authority scope.\n\nThe supplied Thirsty-Lang V0.8.6 release record reports successful positive and negative path conformance across source and distributed artifacts. The adapter remains blocked from sole advancement authority until independent constitutional acceptance.\n\n## 9. Implementation sequence\n\n1. Preserve V3Q sources and traceability.\n2. Implement schemas and static validators.\n3. Implement claim and obligation graph compilation.\n4. Implement role assignment and handoff records.\n5. Implement fixture runner and evidence envelopes.\n6. Implement tiered competence evaluation.\n7. Implement constructive denial and transition records.\n8. Integrate policy adapters behind bootstrap conformance.\n9. Integrate V3Q action gate and independent evaluator.\n10. Run adversarial, migration, rollback, and independent reproduction suites.\n11. Produce owner-ratifiable release artifacts.\n\n## 10. Definition of architectural success\n\nV4 succeeds when a competent engineer can submit an authorized objective and receive a coherent, bounded work package that reveals hidden prerequisites, chooses the smallest useful experiments, coordinates only necessary roles, produces implementation-ready obligations, preserves disagreement, rejects unsupported completion, and leaves an independently reviewable path from source state to trusted decision.\n\n## 11. Owner-operability plane\n\nThe TS3-OCS-1.0 candidate standard adds a cross-cutting owner-operability plane to the Twelve Gates. This is not a thirteenth sequential gate. It is an acceptance condition across every gate.\n\nThe system must preserve a complete owner control loop: observe, understand, decide, authorize, act, verify, recover, learn, preserve, and re-enter. A gate is not owner-operable when its state, consequence, evidence, recovery path, or next safe action exists only in developer-only tooling.\n\nThe owner-operability plane enforces:\n\n- bounded cognitive load with progressive disclosure;\n- decision support without decision seizure;\n- controlled status language;\n- direct claim-to-evidence navigation;\n- owner-visible authority, scope, environment, and freshness;\n- end-to-end recovery and stop paths;\n- complete owner journeys rather than isolated component success.\n\nTS3-OCS-1.0 remains a candidate source. Its inclusion does not claim owner ratification.\n\n## 12. Resolution-integrity boundary\n\nEvery authority-bearing context value resolves into a typed result. `MISSING`, `INVALID`, `UNRESOLVED`, and resolved `FALSE` are non-equivalent. No adapter may coerce an unresolved result into a comparison operand or permission-bearing Boolean.\n\nThirsty-Lang v0.8.6 is recorded as having repaired this boundary across the evaluator, schema validator, runtime, CLI, proof, verifier, broker, explainer, governed interpreter, and composition adapter. The technical result is evidence-bearing; constitutional admission remains a separate transition."}], "authority": {"source_status": "draft_unratified", "ratification_inference_forbidden": true, "live_execution_claim_forbidden": true}, "competencies": ["trusted-transition", "twelve_gates"], "provenance": [{"source_id": "SRC-41E4E03C8DC91A88", "source_path": "canon://authority/architecture/V4_ARCHITECTURE.md", "sha256": "41e4e03c8dc91a88adeed4f04597c06788b18536206147324344c6a25e64064c", "locator": "Gate 12 - TRUSTED TRANSITION", "source_status": "draft_unratified", "transformation": "verbatim gate extraction", "legacy_source_path": "v4-package://architecture/V4_ARCHITECTURE.md"}], "derivation": {"type": "source_grounded_transformation", "synthetic_fixture": false, "human_review_required_before_ratification": true}, "allowed_use": "supervised_fine_tuning", "prohibited_uses": ["independent_capability_evaluation", "automatic_constitutional_ratification", "automatic_trusted_state_pr

eated | Candidate-standard requirement summary; no live owner journey was tested.\n\n1. The Owne
r’s Cockpit Mandate\nOWNER OUTCOME\nThe owner can personally enter the system, understand its co
ndition, direct real work, verify \nthe result, and leave it in a known state.\nThe Owner’s Cock
pit is the governed human-system operating layer between owner intent \nand technical execution.
 It is not a decorative dashboard, a thin launcher, or a report viewer. \nIt is the place where
authority, context, action, evidence, recovery, and continuity become \nusable by the person acc
ountable for the system.\nWhy this matters\nA system may pass thousands of tests and still fail
its owner if it cannot be started, \nunderstood, operated, or stopped without developer mediatio
n. That failure is not cosmetic. It \nis a broken control pathway between ownership and operatio
n.\nImplementation standard\n Design from the owner’s job-to-be-done rather than from the exist
ing service topology.\n Make the shortest safe path visible: start, understand, act, verify, re
cover, stop.\n Treat owner usability as a production capability with tests and evidence, not as
 \ndocumentation polish.\n Keep the cockpit honest when underlying capabilities are partial, ab
sent, degraded, or \nexternally blocked.\n Provide a coherent operating surface while preservin
g component boundaries underneath.\nNormative requirements\nID Normative requirement Required ev
idence Acceptance test Failure state\nOC-1.1\nThe system SHALL provide an \nowner-accessible ent
ry point that \ndoes not require source-code \nediting or undocumented \ncommands.\nRecorded lau
nch \npath, executable \nentry point, owner \nguide.\nA non-programmer \nowner starts from a \ns
topped machine and \nreaches the cockpit.\nOpen\nOC-1.2\nThe cockpit SHALL expose \ncurrent syst
em state, available \nactions, and known limitations \nbefore asking the owner to act.\nState sn
apshot, \ncapability inventory, \nlimitation registry.\nFirst-session \nwalkthrough identifies \
nwhat is running and \nwhat is not.\nUnknown\nOC-1.3\nThe owner SHALL be able to \ncomplete at l
east one real \ngoverned workflow and observe \nits evidence trail.\nAction receipt, \nbackend t
race, \nresulting state.\nExecute the workflow \ntwice from clean local \nstarts.\nUnproven\n\nH
ostile review\n Could the interface display success while the governed operation failed, timed
out, or never \nran?\n Could a technically valid operator become lost because the next action,
consequence, or \nrecovery path is not visible?\n Could stale, partial, cached, or simulated da
ta be mistaken for current verified state?\n Could any visual or conversational path bypass the
 same authority, policy, evidence, and \naudit controls used by the backend?\nCHAPTER ACCEPTANCE
 RULE\nAccepted only when the owner—not merely an engineer or test runner—can complete the \nful
l start-to-proof-to-stop loop."}], "authority": {"source_status": "candidate_for_owner_ratificat

ionship to Thirsty’s Standard v3, into an owner-operability requirement set. Preserve the candid
ate status and do not claim conformance for a live system."}, {"role": "assistant", "content": "
STATUS: Created | Candidate-standard requirement summary; no live owner journey was tested.\n\n2
. Relationship to Thirsty’s Standard v3\nOWNER OUTCOME\nEvery cockpit behavior extends the same
truth, evidence, safety, continuity, and completion \nrules that govern the engineering beneath
it.\nThis extension is additive. Thirsty’s Standard v3 remains the governing execution contract;
 \nthe Owner’s Cockpit Standard translates those obligations into human-facing interaction, \nin
terface, operational, and acceptance requirements.\nWhy this matters\nWithout explicit inheritan
ce, a polished interface can become a loophole: a place where \nuncertain state is beautified, p
artial work is called complete, or ungoverned actions escape \nthe controls applied elsewhere.\n
Implementation standard\n Apply the v3 priority order to every interaction and design conflict.
\n Map no-fake-success, evidence-before-claims, fail-closed, continuity, hostile review, and \n
production readiness into visible UI behavior.\n Do not let a surface claim more certainty, rea
diness, authority, or safety than runtime \nevidence supports.\n Treat broken links, fake comma
nds, dead buttons, and misleading labels as pathway-integrity \ndefects.\n Use the v3 final-rep
ort discipline for cockpit implementation and releases.\nNormative requirements\nID Normative re
quirement Required evidence Acceptance test Failure state\nOC-2.1\nNo cockpit claim SHALL exceed
 \nthe verification state permitted by \nThirsty’s Standard v3.\nClaim-to-evidence \nmapping and
 UI state \ntests.\nRemove or falsify \nevidence and confirm \nthe claim degrades to \nUnknown/N
ot verified.\nFalse claim\nOC-2.2\nEvery cockpit action path SHALL \npreserve the same governanc
e \nand verification controls as direct \nbackend execution.\nRoute map, policy-\ngate traces, n
egative \ntests.\nAttempt the action \nthrough every UI/API \npath and verify \nidentical enforc
ement.\nBypass\nOC-2.3\nCockpit work SHALL maintain a \ntruthful operational continuity \nrecord
.\nCurrent continuity \nmap and change \nevidence.\nA new operator \nreconstructs the last \nses
sion without chat \nmemory.\nStale\n\nHostile review\n Could the interface display success whil
e the governed operation failed, timed out, or never \nran?\n Could a technically valid operato
r become lost because the next action, consequence, or \nrecovery path is not visible?\n Could
stale, partial, cached, or simulated data be mistaken for current verified state?\n Could any v
isual or conversational path bypass the same authority, policy, evidence, and \naudit controls u
sed by the backend?\nCHAPTER ACCEPTANCE RULE"}], "authority": {"source_status": "candidate_for_o

t": "STATUS: Created | Candidate-standard requirement summary; no live owner journey was tested.
\n\n3. Owner, Operator, Developer, and User Roles\nOWNER OUTCOME\nThe interface respects that th
e accountable owner may not be the person who writes the \ncode—and does not punish that distinc
tion.\nThe standard separates legal or operational accountability from technical implementation
\nskill. One human may hold several roles, but the cockpit must not assume that ownership \nrequ
ires command-line fluency or that a developer automatically holds owner authority.\nWhy this mat
ters\nRole confusion causes both unsafe power and needless obstruction. A solo owner can be \ntr
apped behind fictional enterprise approvals, while a technically capable operator can be \ngrant
ed authority they were never given.\nImplementation standard\n Model authority, capability, acc
ountability, and technical skill as separate attributes.\n Permit a sole owner to hold legitima
te development authority for repository-controlled work.\n Require explicit delegation when ano
ther actor may approve, deploy, publish, sign, or alter \nprotected state.\n Never infer author
ity from UI access, technical expertise, employment title, or agent \nconfidence.\n Show the ac
ting identity, delegated scope, and consequence boundary before consequential \nactions.\nNormat
ive requirements\nID Normative requirement Required evidence Acceptance test Failure state\nOC-3
.1\nThe cockpit SHALL distinguish \nowner, operator, developer, \nreviewer, and end-user \ncapab
ilities in its authorization \nmodel.\nRole matrix, policy \ntests, identity records.\nTest each
 role against \nallowed and denied \nactions.\nOverbroad\nOC-3.2\nA solo owner configuration SHA
LL \nNOT require invented \norganizational roles to complete \nrepository-controlled development
 \nwork.\nSolo-owner policy \nprofile and test \nfixture.\nComplete a repository \nworkflow with
out \nfictional CAB or team \napprovals.\nArtificial block\nOC-3.3\nExternal authority requireme
nts \nSHALL remain explicit and shall \nnot be simulated by owner mode.\nExternal-dependency \nr
egistry and denial \nreceipts.\nRemove credentials or \nexternal assets and \nverify fail-closed
 \nbehavior.\nFabricated\n\nHostile review\n Could the interface display success while the gove
rned operation failed, timed out, or never \nran?\n Could a technically valid operator become l
ost because the next action, consequence, or \nrecovery path is not visible?\n Could stale, par
tial, cached, or simulated data be mistaken for current verified state?\n Could any visual or c

\n\n11. Decision Support Without Decision Seizure\nOWNER OUTCOME\nThe system helps the owner und
erstand tradeoffs and consequences while preserving the \nowner’s legitimate final authority.\nD
ecision support should structure options, evidence, reversibility, risk, and expected \nconseque
nce. It must not silently convert a recommendation into an action or manipulate \nurgency to for
ce acceptance.\nWhy this matters\nAn AI system can appear helpful while narrowing the owner’s ch
oices, hiding dissent, or \npreselecting irreversible actions. That is control disguised as assi
stance.\nImplementation standard\n Separate recommendation, authorization, execution, and verif
ication as distinct events.\n Present the recommended option alongside meaningful alternatives
and “do nothing” where \nvalid.\n Identify reversible versus irreversible consequences before a
uthorization.\n Avoid dark patterns, forced defaults, countdown pressure, and misleading button
 hierarchy.\n Record the owner’s decision and the evidence available at that time.\nNormative r
equirements\nID Normative requirement Required evidence Acceptance test Failure state\nOC-11.1\n
A recommendation SHALL NOT \nexecute without the authority \nrequired by the action contract.\nS
eparate \nrecommendation and \nexecution records.\nGenerate a \nrecommendation and \nconfirm no
side effect \noccurs.\nSeized\nOC-11.2\nMaterial alternatives and \nconsequences SHALL be visibl
e \nbefore approval.\nDecision comparison \nand usability test.\nOwner explains \ntradeoffs befo
re \ncommitting.\nObscured\nOC-11.3\nIrreversible or high-impact actions \nSHALL require explici
t, \nunambiguous confirmation bound \nto exact scope.\nConfirmation receipt \nand scope hash.\nM
odify scope after \nconfirmation and verify \nre-approval is required.\nStale approval\nHostile
review\n Could the interface display success while the governed operation failed, timed out, or
 never \nran?\n Could a technically valid operator become lost because the next action, consequ
ence, or \nrecovery path is not visible?\n\n Could stale, partial, cached, or simulated data be
 mistaken for current verified state?\n Could any visual or conversational path bypass the same
 authority, policy, evidence, and \naudit controls used by the backend?\nCHAPTER ACCEPTANCE RULE

"STATUS: Created | Candidate-standard requirement summary; no live owner journey was tested.\n\n
18. Accessibility and Inclusive Operation\nOWNER OUTCOME\nThe cockpit remains operable by keyboa
rd, screen reader, zoom, alternative input, and \nvaried sensory or cognitive needs across the c
omplete owner process.\nAccessibility is a pathway property. The target is WCAG 2.2 Level AA for
 the complete owner \njourneys, supplemented by WAI-ARIA Authoring Practices and tested human us
e. \nConformance of isolated components is not enough if the process breaks.\nWhy this matters\n
An inaccessible approval, recovery, authentication, or evidence step can exclude the \naccountab
le owner from control of their own system. That is an authority failure as well as a \nusability
 failure.\nImplementation standard\n Use semantic HTML and native controls before custom widget
s.\n Provide keyboard-visible focus, logical order, accessible names, status announcements, and
 \nerror association.\n Meet contrast, reflow, target-size, timing, and authentication requirem
ents for relevant \ncontent.\n Avoid motion, flashing, or auto-updating behavior that cannot be
 controlled.\n Test complete owner journeys with automated scans and manual assistive-technolog
y \nchecks.\nNormative requirements\nID Normative requirement Required evidence Acceptance test
Failure state\nOC-18.1\nAll critical owner journeys SHALL \nconform to WCAG 2.2 Level AA \nexcep
t documented, approved \nexceptions with remediation plans.\nAutomated reports, \nmanual checkli
st, \nexception record.\nRun the complete \njourney by keyboard \nand screen reader.\nNonconform
ant\nOC-18.2\nDynamic status and errors SHALL \nbe programmatically conveyed \nwithout stealing
focus \nunexpectedly.\nARIA/live-region tests \nand manual review.\nTrigger status updates \nusi
ng assistive \ntechnology.\nSilent\nOC-18.3\nNo critical action SHALL depend \nsolely on pointer
 precision, color \nperception, hearing, or time-\nlimited response.\nAlternative-input and \nse
nsory review.\nComplete actions \nusing keyboard and \nnon-color cues.\nExclusion\n\nHostile rev
iew\n Could the interface display success while the governed operation failed, timed out, or ne
ver \nran?\n Could a technically valid operator become lost because the next action, consequenc
e, or \nrecovery path is not visible?\n Could stale, partial, cached, or simulated data be mist
aken for current verified state?\n Could any visual or conversational path bypass the same auth
ority, policy, evidence, and \naudit controls used by the backend?\nCHAPTER ACCEPTANCE RULE\n\nT
S3-OCS // COMMAND SECTOR 04 // OWNER CONTROLLED\nPART IV\nOPERATIONAL COCKPIT SURFACES\nDefines
the minimum family of owner-facing surfaces required to launch, \nsupervise, prove, secure, reco
ver, release, and stop a real system.\nACCEPTANCE BOUNDARY\nComplete only when owner outcomes ar
e demonstrated through complete journeys \nand every mandatory requirement resolves to current e
vidence.\nNO PROOF. NO CLAIM. NO OWNER LEFT OUTSIDE THE SYSTEM."}], "authority": {"source_status

ormance, Audit, and Ratification, into an owner-operability requirement set. Preserve the candid
ate status and do not claim conformance for a live system."}, {"role": "assistant", "content": "
STATUS: Created | Candidate-standard requirement summary; no live owner journey was tested.\n\n4
8. Conformance, Audit, and Ratification\nOWNER OUTCOME\nThe owner can determine exactly which le
vel the cockpit meets, which requirements remain \nopen, and who has authority to ratify the cla
im.\nConformance is evidence-based and scoped to version, environment, surfaces, and \njourneys.
 The standard defines four levels: OC-1 Owner-Usable, OC-2 Evidence-Governed, \nOC-3 Production-
Operational, and OC-4 Assured.\nWhy this matters\nA standard becomes theater when teams self-awa
rd conformance from intention or partial \nchecklists. Ratification requires traceability, indep
endent challenge appropriate to level, and \ntruthful open findings.\nImplementation standard\n
 Declare conformance scope, exclusions, version, environment, and evidence date.\n Meet every m
andatory requirement for the claimed level or disclose nonconformance.\n Use independent review
 for OC-3 and stronger assurance for OC-4.\n Publish a requirements traceability matrix and res
idual-risk record.\n Require owner ratification before representing the cockpit as conformant o
n the owner’s \nbehalf.\nNormative requirements\nID Normative requirement Required evidence Acce
ptance test Failure state\nOC-48.1\nConformance claims SHALL \nidentify exact scope, version, \n
environment, level, evidence set, \nand open exceptions.\nConformance \nstatement and matrix.\nA
ttempt to interpret \nclaim without outside \ncontext.\nOverbroad claim\nOC-48.2\nNo level SHALL
 be claimed while \na mandatory requirement for that \nlevel lacks accepted evidence.\nAutomated
/manual \nconformance gate.\nRemove evidence for \none mandatory \nrequirement.\nChecklist theat
er\nOC-48.3\nFinal ratification SHALL be \nperformed by the legitimate owner \nor explicitly del
egated authority.\nSigned ratification \nrecord.\nInspect authority and \nscope of approval.\nUn
authorized \nclaim\nHostile review\n Could the interface display success while the governed ope
ration failed, timed out, or never \nran?\n\n Could a technically valid operator become lost be
cause the next action, consequence, or \nrecovery path is not visible?\n Could stale, partial,
cached, or simulated data be mistaken for current verified state?\n Could any visual or convers
ational path bypass the same authority, policy, evidence, and \naudit controls used by the backe
nd?\nCHAPTER ACCEPTANCE RULE\nAccepted only when the completed traceability matrix, evidence bun
dle, exceptions, and \nowner ratification all refer to the same cockpit version and declared sco
pe.\n\nAPPENDIX A — REFERENCE ARCHITECTURE\nA minimum logical architecture. Implementations may
vary, but control and evidence \nboundaries may not disappear.\nLayer Responsibility Prohibited
shortcut\nOwner experience Orientation, task journeys, decisions, evidence \naccess, recovery, a
ccessibility.\nNo local claim or permission becomes \nauthoritative.\nGoverned action \ngateway\
nIdentity, authority, policy, scope, approval, \nidempotency, action state. No direct UI-to-side
-effect bypass.\nOrchestration and \nagents\nPlanning, delegation, tool use, coordination, \nbou
nded autonomy. No capability-based authority or hidden handoff.\nDomain services Authoritative b
usiness and system behavior. No duplicate frontend business rules treated as \nproof.\nEvidence
and audit Receipts, provenance, integrity, supersession, \nexport.\nNo mutable success summaries
 without raw \nproof.\nObservability Metrics, logs, traces, incidents, synthetic journeys. No li
veness-only health or stale-as-current data.\nInfrastructure and \nexternal systems\nRuntime, st
orage, network, credentials, third \nparties.\nNo fabricated external availability or production
 \nevidence.\n\nMinimum trust boundaries\n Browser or desktop client to governed backend.\n Hu
man or agent identity to authorization decision.\n Model-generated proposal to deterministic ac
tion validation.\n Repository-controlled system to external infrastructure, credentials, or aut
hority.\n Operational state to evidence ledger and long-term audit.\n Untrusted imported conte
nt to instruction and tool execution."}], "authority": {"source_status": "candidate_for_owner_ra

 "STATUS: Created | Candidate-standard requirement summary; no live owner journey was tested.\n\
n24. Release, Deployment, and Rollback\nOWNER OUTCOME\nThe owner can see exactly what candidate
is being released, which gates passed, what \nremains external, and how to stop or reverse the c
hange.\nThe release surface binds immutable candidate identity to gate evidence, approvals, \nen
vironment, deployment execution, observation, and rollback readiness. Local success and \nproduc
tion authorization remain distinct.\nWhy this matters\nRelease ambiguity is dangerous because “t
he code passed” can refer to a different commit, \nenvironment, or partial gate. The cockpit mus
t prevent evidence drift and substitute closure.\nImplementation standard\n Identify the releas
e candidate by immutable commit and artifact digest.\n Show each gate’s exact success criterion
, current evidence, and closure authority.\n Separate repository-controlled readiness from owne
r, infrastructure, and external obligations.\n Require deployment and rollback plans that refer
ence real commands, assets, and decision \nthresholds.\n Observe post-deployment behavior and r
ecord the production verdict.\nNormative requirements\nID Normative requirement Required evidenc
e Acceptance test Failure state\nOC-24.1\nRelease evidence SHALL be \nbound to the exact candida
te and \nenvironment it qualifies.\nCommit/artifact digest \nin each gate receipt.\nChange candi
date and \nverify evidence \ninvalidation.\nEvidence drift\nOC-24.2\nA whole-gate criterion SHAL

.\n\n36. Delivery Pipeline and Reproducibility\nOWNER OUTCOME\nThe owner can trust that the cock
pit being reviewed, packaged, and released corresponds \nto a known source state and repeatable
process.\nBuild and delivery pipelines should be reproducible, isolated, observable, and tied to
 \nimmutable inputs. A clean-checkout gate verifies that undocumented local state is not part of
 \nthe product.\nWhy this matters\nA green developer workspace can conceal untracked files, cach
ed dependencies, local \nservices, or permissive settings. Reproducibility is the bridge from im
plementation evidence \nto release confidence.\nImplementation standard\n Build from clean, iso
lated source with locked dependencies.\n Generate artifact digests, software bills of materials
 where appropriate, and provenance.\n Run tests and gates against the exact candidate being pac
kaged.\n Treat harness and environment limitations as solvable engineering problems until prove
n \nexternal.\n Record time-cost separately from genuine blockers.\nNormative requirements\nID
Normative requirement Required evidence Acceptance test Failure state\nOC-36.1\nRelease candidat
es SHALL be \nbuilt from a clean isolated \ncheckout with recorded source \nidentity.\nClean-che
ckout \nreceipt and commit \nhash.\nRebuild in a new short-\npath worktree or CI \nenvironment.\
